

As many as **3 in 5** people with type 2 diabetes have a build-up of fat in their liver.

If you have type 2 diabetes, you may also have non-alcoholic fatty liver disease (NAFLD). NAFLD is a condition in which fat builds up in your liver, even if you drink little or no alcohol. NAFLD can often develop without any symptoms, so people may not be aware they have a fatty liver.

A new clinical research study is assessing a study drug for people with type 2 diabetes and NAFLD.

*There are other requirements for participation in this clinical research study. The study doctor will explain these to you.

This clinical research study may be an option for men, or women unable to bear children, who:*

- ▶ are aged between 18 and 70 years old
- ▶ are being treated for type 2 diabetes with at least 500 mg metformin daily
- ▶ have a waist measurement of at least 40 in/102 cm (men) or 35 in/89 cm (women)

To find out if this clinical research study may be right for you, please ask us during your appointment or contact us at:
